Abstract (en)
A toy comet comprises an inertial body (1), a line (2) secured to the body (1) and the line from the user in operation, and a light, flexible tail (3) arranged to trail from the body when the body is thrown. The body (1) is made of deformable, resilient material and has a diametral hole (4) therethrough. The line (2) is secured to the tail (3) at a junction (6) which is enlarged relative to the line (2) and is larger than the width of the hole (4). The line (2) runs along the hole (4) in the body (1) and is secured to the body (1) by the enlarged junction (6) wedging in the hole (4) with the line (2) emerging from one end of the hole (4) and the tail (3) emerging from the other end (7) of the hole (4). Preferably the body (1) has a protruding neck (5) in the shape of a truncated cone.
