Abstract (en)

[origin: EP0133147A2] The winding device comprises an elongated casing (5), the receptacle (8) of which encloses a reel (9) onto which the document (14) in the form of a sheet is wound. The document (14) is fastened at one end to the reel (9) and at the other end to a gripping means (17), and emerges from the receptacle (8) through a longitudinal slot (13). A spring (24) causes the winding up of the document. The casing (5) also comprises two resilient walls (22, 23) forming a clamp, for fitting to a ski pole. <IMAGE>
