Abstract (en)

[origin: US4572412A] A container, in particular a bottle, made of a plastic which can be elastically deformed. The container has a pipe for filling and removing the contents. The container has a part which can be folded in in its main part or in its shoulder section. The pipe can be brought into an inclined position relative to the axis of the container by a folding-in operation, by which the container contents can be emptied or poured out at an angle while the container is held vertical but upside down.
