Abstract (en)

[origin: EP0134440A2] The pendulum-swinging door has a supportive structure comprising a vertical and a horizontal shank, and a door leaf made of flexible material. The supportive structure consists of an angular piece (1), forming the top corner of the door. Its vertical shank (2) reaches down to half the doorway's clear height, at the most. There it is mounted in a bottom bearing (5), located at this level. The horizontal shank (3), similarly extending only over a small part of the door wing width, is prolonged by two rectangular profiles (6), at approx. door width. The door leaf (8) is held between these.
