Abstract (en)
[origin: US4566591A] The invention relates to a multiple packaging system for a plurality of containers having edge flanges and being closable with covers, which containers are held together with a connecting element made of a flat cut-out. The cut-out is raised from underneath the containers to the underside of the edge flanges and is firmly attached to a cover sheet which makes up the covers. In addition, there are punched-out flaps in the cutout which can be inserted into one another to form a support structure between individual containers so that the stability of the multiple packaging system is improved.
