Abstract (en)

[origin: EP0135439A1] 1. Device of fast fixing for a terminal cover (10) of a casing of an electric apparatus, comprising a fixing screw (12) mounted in rotation by turn fraction on the terminal cover and carrying an operation head (16) at one of its ends and at the opposite end a block (20) likely to fit into fixing position in an interlock conjugated housing (13) arranged in said casing, said head (16) carrying radially on one of the sides in operation lever (22) mounted in tipping on said screw head to occupy a lowered locked position of the lever or a raised position to permit a limited rotation of the lever and of the associated screw in order to set free the block (20) out of its housing and to disconnect the terminal cover (10) from the casing, characterized in that the screw (12), the block (20) and the lever (22) are made by a part moulded in plastic, the lever (22) being fastened to the screw head (16) by a slim part forming a tipping hinge (28), and that a groove (24) for housing said lever (22) is arranged in said terminal cover (10) to receive in insertion with small clearance the lever (22) and to lock the lever and the screw (12) in fixing position.
