Abstract (en)

[origin: EP0136244A1] 1. A weaving mechanism of the type comprising two tong frames (14, 15) which are positionally displaced alternately relative to one another by means of four connecting rods (10, 11-12, 13) displaced by a mechanism comprising a connecting rod-crank system (2, 3) driving a first rocking lever (5) connected to the second (8) by means of a link rocker bar (7), characterized in that the link rocker bar (7) of the rocker levers (18, 21) comprises means for being coupled thereto so that the said rocker bar (7) causes inverse rocking of the second (21) relative to the first (18), and that the control connecting rods (10, 11-12, 13) of the frames (14, 15) are directed symmetrically.
