Abstract (en)

[origin: WO8403173A1] Switching apparatus with automatic opening, wherein the reset is operated by an action similar to that which produces a sectioning. A movable contact (87), housed in a slide (88) accessible on the front face (124) of the casing (82) may be opened either by a resilient sudden triggering device (94) which is itself directly or indirectly released by a striker (92) associated to a coil (91) or, and with a distance establishing a sectioning of the line, by the slide itself, the latter being also used to reset the device (94). Such an apparatus can be conveniently arranged within a modular casing (82) of reduced width, used in tertiary or domestic distribution boxes.
