Abstract (en)

[origin: WO8403225A1] Device for fixing a shoe (12) to a ski (11), particularly a cross-country ski, with a coupling element (10) enabling a flexure and arranged in an upright plane, which is connected by its end directed towards the front of the ski to the ski body (11) and which may be connected by the other end, directed to the rear part of the ski, to the shoe (12). In order to improve the force transfer to the ski, to increase the contact with the ski, as well as to reduce the shoe deformations, it is possible to connect the coupling element (10) configured preferably as a leaf spring to the shoe (12) by the region (16) where the ball of the foot rests, or therebehind.
