Abstract (en)  
[origin: ES281798U] A cap closure for containers with pharmaceutical contents, especially for bottle-shaped containers possessing tear-open tabs and containing substances destined for injection, infusion or transfusion, is constructed such that a stopper can be pulled from the container without contaminating the sterile pouring rim thereof. A lifting-off part provided on the closing cap is intended to engage with the stopper. The tear-open tab and a grip piece form a pulling element for lifting off the stopper on which the lifting-off part acts.
