Abstract (en)  
[origin: WO8403079A1] A food package is formed by a semi-rigid base (2) and a semi-rigid cover (3). The base comprises a raised pedestal (5) surrounded by the planar flange. The cover comprises a cavity for receiving and holding compressible and generally sliced food product surrounded by a planar flange. Cavity depth is sufficiently deep to contain the produce and to telescopically receive the base pedestal. A cover locking means contained in the base and cover vertical walls provides for snap locking the base and cover. On application of pressure and vacuum the base and cover are drawn together compressing the food product against all inner walls of base and cover that can contact the product. The pedestal is of sufficient depth to provide the necessary travel to push on and compress the food product within the cavity and remove any voids or trapped gas so that on evacuation and sealing of the flanges the product remains in contact with inner portions of the package.
