Abstract (en)

[origin: EP0138206A2] Such an arrangement is dependent on the reception of certain sequences of acoustic pulses in the audible noise range which are received by a transducer and converted into electrical signals which are fed via an amplifier to a pulse-shaping circuit whose output pulse sequence is tested by a test circuit containing a counter for predetermined parameters such as number of pulses and pulse spacing and in the event of a positive test a control signal is emitted, the following adjustable specified parameters being tested by means of the test circuit: alpha) the time interval DELTA ti between the pulses Ci and Ci+1 is less than a specified time interval DELTA timax, beta) the number of consecutive pulses fulfilling the condition alpha is equal to a reference number n and gamma) after the last input pulse a time period DELTA tn max elapses without a further input pulse occurring. <IMAGE>
