Abstract (en)

[origin: US4596103A] A stone set is described in which a fundamentally known base stone, especially a base stone of concrete or the like, with a principally L-shaped cross-sectional surface is used. The base stone (1) has on its first and second legs (2; 3) a first and second seat (4; 7), respectively. The seats (4; 7) are formed complementary to one another as a recess or projection. In an assembly of exclusively base stones the result is a wall inclined relative to the vertical. The wall set in accordance with the invention, in contrast to this, makes possible the construction of a vertical wall through the use of a supplemental stone (10) with a likewise L-shaped cross-sectional surface. On its first leg (12) a first and second seat (15; 14) are provided on its upper and lower sides, to engage the first and second seat (4; 7) of base stones (1) located above and below it. The stones arranged in an assembly are similarly oriented and aligned. The supplemental stone engages with the free end of its second (vertical) leg (13) the base stone (1) located below it so that the wall assembly receives greater stability.
