Abstract (en)
[origin: ES8501022A1] A yarn guide bar member 14, instead of being driven mechanically from the main eccentric shaft is reciprocated by an endless belt 9 driven by a servo-motor 1 through belt transmission 4. The electronic control 18 for the servo-motor includes a program control 24 determining the end positions of the yarn guide in accordance with the pattern. Position (15) and speed (16) feedbacks control the servo-motor by comparison with required values. Electronic synchronization with the main eccentric shaft is provided. A sinker cam is similarly driven the drives for the latter and for a plurality of yarn guide bars may be arranged together at one end of the machine.
