Abstract (en)
[origin: EP0140690A2] This invention discloses a lighting installation which employs a reflector shield of a certain shape which is designed to provide non-directionalized reflection of light back into the room which would otherwise be lost towards the ceiling around the installation. The reflector (1) has a highly reflective surface and comprises an elongate member having two wings (4) disposed symmetrically about a line (5) at which they join together. Each wing (4) has a plurality of facets each running the full length of the wing and which are positioned at gratatory angles to one another so that the light from the lighting element is reflected downwardly and diffusely therefrom. This reflector maximizes the reflection of the light and reduces the number of light fixtures required.
