Abstract (en)

[origin: ES8603059A1] The bottle comprises a closed vessel (2) with dished ends (4,5). The upper dished end has a penetration for the refrigerant inlet (6) and one for the outlet (7). An inverted cup inner skirt (15-17) forms a baffle for the refrigerant gas flow. - An outer jacket (30) encloses the bottle and forms a passage for the exhaust gases from the internal combustion driving engine, entering at the base (32) and discharging at the top (33). Heat exchange takes place across the wall (3) of the closed vessel.
