Abstract (en)

1. Process for stiffening a cushion (1) of flexible synthetic material containing a liquid and for providing this cushion with a grasping and pouring handle, characterised in that during the phase of welding and cutting-out of the liquid-filled cushion (1) one of the corners thereof is pinched, the cushion then being displaced with the corner pinched, which gives a support point by the combination of the pinching effect and the weight of the liquid contained in the cushion, and in that a counter-stiffening (7, 8) is applied to the angle (2) by means of jaws (5, 6), the said counter-stiffening (7) being made fast with the cushion by welding or sticking.

Abstract (fr)

Lors de la phase de soudure et de découpe du coussin (1), on pince l'un des coins (2) de celui-ci. On obtient ainsi un point d'appui pour appliquer l'élément de préhension et de versage. Application: conditionnement de liquides.
