Abstract (en)
[origin: WO8402963A1] A mechanism for restraining a work holder to co-ordinated motion comprising a support member (9) with a planar upper surface, a work holder (10) moveable over said surface, a control bar (12) parallel to said surface along which said work holder (10) is slidable and swing link means (14, 15) mounted to said control bar (12) to restrict its movement to bodily translation of the bar in directions perpendicular to its longitudinal axis thereby permitting free movement of the work holder simultaneously along each of two orthogonal co-ordinates while maintaining its orientation unchanged.
