Abstract (en)
[origin: US4587747A] A ski boot with rear entry including a rigid shell integrally formed with a front part of an upper, opened towards the rear throughout its height and of a sort to be closed by a shield articulated on the boot in such a way as to be provided with at least two degrees of freedom, which permits every movement thereof, albeit limited, both in rotation and in translation in a substantially vertical plane, when the fastening means are in a closed position. It is possible, hence, to ensure the best possible fitting of the shield to the shape of the ankle and of the lower part of the calf. The shield may be articulated on the boot through its lower end in such a way as to permit play.
