Abstract (en)

[origin: WO8404849A1] The current transformer provided with a primary winding (1), a secondary winding (2) and a detector winding (3) has a rigid coupling between the secondary winding (2) and the detector winding (3), and yet the coupling coefficient between those windings (2, 3) and the primary winding (1) is well under one, since only a portion of the magnetic flux  $\Phi$  generated by the current  $I_1$  to be measured in the primary winding (1) is detected by the detector winding (3). This partial flux  $\Phi$  is compensated by the flux produced by means of a regulating amplifier arranged in the secondary winding (2).
