Abstract (en)
[origin: WO8501756A1] A cylinder of the bar is provided with struts between which the needles are axially movable. The bar is comprised of juxtaposed segments (12) having preferably the same width, along the periphery of the cylinder (11). The segments are formed of juxtaposed struts (13, 14) having different heights which alternate in regular sequences. The struts are held together by means of cleats (16) made of metal or plastic material and cast into recess (15) preferably on the lower side and extending throughout the width of the segments.
