Abstract (en)
[origin: EP0144829A2] The container closure is made of plastic and consists of a closure underpart (3) which can be connected to the container neck (1) and of a cap (5) which can be releasably connected to the closure underpart. So that the container closure can be removed from the opening of the container only with a remaining indication that this has been carried out, it is provided, according to the invention, for the cap (5) to have, at least on part of its periphery, an extension (10) which engages around the container neck (1) and which is connected integrally to the cap (5) by means of easily breakable webs, and for the cap (5) to be releasably anchored on the closure underpart (3) in such a way that this anchorage (16, 17) can be detached only at the same time as or after the breaking of the webs from the extension (10). <IMAGE>
