Abstract (en)

[origin: EP0145062A2] The extruded blocks (0) have vertical hollows (9-14) separated by relatively thin partitions (8) and the block faces contacting other blocks are machined to be flat within a fraction of a millimetre. Part of the partitions are cut to form continuous channels extending perpendicular to the hollows and to join the channels with part of the hollows. The masonry is dry built using the blocks, steel reinforcement is placed in the channels and or the hollows, and cement mortar is poured in the hollows and channels, to form a continuous framework.
