Abstract (en)
[origin: FR2547651A1] Target carrier devices intended to the training at shooting, particularly rapid shooting. The target carrier device provides for the positioning and displacement of the target and comprises a triaxial mechanism for rotating the target, which mechanism combines an axial target pivoting module (5), a rocking module (6) for rocking the pivoting module and an orientation module (7) for orientating the rocking and pivoting modules so as to vary the displacements of the target between hidden and at sight positions with respect to the shooters, as well as to vary said positions by selection of a rotation motion or a combination of the three motions. The modular structure of the device enables to use optionally one or two of the three modules or to combine those modules.
