Abstract (en)
[origin: WO8404503A1] The vehicle tilting device comprises moving frames (1-2) which are rigidly fixed to the hub of the wheels (21-27) by means of an adjustable mechanism (14, 25) secured to a transverse bar (10) which is rigidly welded to bent shaped sections (3-4) of which the curvature radius center passes exactly by the gravity center of the vehicle (30) which is thus in a position of balanced transversal rotation enabling the access to all inner and outer parts of the vehicle (30).
