Abstract (en)

[origin: EP0146737A1] 1. Device for actuating an opening apparatus, which together with life-saving equipment is located in a casing which is under vacuum and which opens the casing by pulling on a first pull member surrounded by the casing, a second pull member extending outside the casing being provided for transmitting a pulling force to the first pull member, characterised in that the first pull member (6) extends in a tubular projection (2) of the casing (1) and at its point remote from the opening apparatus is provided with or connected to a thickened portion (7), whereof the cross sectional surface arranged at right angles to the direction of extension of the first pull member (6) is substantially greater than that of the first pull member (6) and that placed around the first pull member (6) between the opening apparatus and thickened portion (7), including the tubular projection (2) of the casing (1) is the second pull member (15) with a loop (16), whereof the cross sectional surface is greater than that of the first pull member (6) and smaller than that of the thickened portion (7).
