Abstract (en)

[origin: EP0146782A2] 1. An adaptor device for establishing a separable electrical connection between contact elements (13) of a first electrical component (3), e.g. a module to be tested, and contact elements (5) of a second electrical component, e.g. an automatic testing device, characterised in that an exchangeable circuit board (1) is provided, which itself has through-contacts (2) arranged in the grid dimensioning of the contact elements (13) of the first component (3), which has contact spots (4) arranged in the grid dimensioning of the contact elements (5) of the second component, and which has connection lines (6) between the through-contacts and the contact elements ; and that connection members (7) are provided which are displaceable in the through-contacts (2) relative to the circuit board (1), by the displacement of which, contact can be established between the contact elements (13) of the first component (3) and the connection members (7) and between the connection members (7) and the through-contacts (2).
