Abstract (en)

[origin: ES8601054A1] The microprocessor controlled filling system incorporates a weighing stage in conjunction with the volumetric measure in order to modify the volumetric dosage. The vessel is weighed when empty and the weight memorised. The liquid is delivered from a reservoir through a filling nozzle. - A continuous weighing system (36) is used to control the delivered volume by means of a control system which uses the result of the weighing to control the fluid delivery through either the modification by means of a motor driven screw, of the profile of a cam which determines the displacement of the delivery piston (28) or by counting the number of revolutions of a rotary delivery pump. The filled vessel is automatically weighed and the delivery settings modified to maintain accurate control as the filling process continues.
