Abstract (en)

[origin: EP0148037A1] 1. A contact connection device comprising at least one and preferably a plurality of individual contacts having a contact element (1b, 2b), a body (1a, 2a) and a connecting lug or output (1c, 2c), an insulating support or case (3, 10) having an equal number of housings (4a, 11a, 12a) for receiving said contacts individually, these latter being inserted into the housings in the direction of the connecting lug or output, which passes through the bottom of the housing, and means for retaining the contacts in their housings so as to oppose removal thereof, the contact body (1a, 2a) having a retaining shoulder (1d, 2d) adapted to come during insertion into abutment against a complementary shoulder (4d, 11d, 12d) of the housing which receives it for limiting insertion of the contact, characterized in that the connecting output (1c, 2c) initially disposed in the extension of the body is bent back outwardly of the housing against a surface (5b) of the support (3, 10) preventing removal of the contact.
