Abstract (en)

Pyjamas are described particularly carried out for use by bed-ridden patients in hospitals and provided with closeable openings to allow the body examination by the medical staff. The openable closing devices can be repeatedly openend and reclosed and are located so that, when opened, openings of the pyjamas are available, capable of making the approach and the execution of auscultations, measurements of pressure, phleboclyses, electrocardiograms and the like, easier. According to the needs, openable closing devices can be provided on one or both of the sides (40, 40 min) of the jacket (12), on one or both the sides (52, 52 min) of the trousers (14), on one or both of the shoulders (32, 32 min) and on the top part (30, 36 min) of one or both of the sleeves, on the centre of the front part of the jacket, on the centre of the back part of the jacket, on the bottom part of one or both of the sleeves, at the crutch and, or on the innermost part of the legs.
