Abstract (en)  
[origin: EP0149492A2] The invention relates to a door hinge for motor vehicles with a frame part, a door part and a pin connecting the two to form a joint. According to a first proposal, the actual joint is formed by at least one joint sleeve and a multilayer bush known per se, the joint sleeve being connected fixedly in terms of rotation to the pin anchored in the frame part. According to a second proposal of the invention, there is a multilayer bush which is rotated relative to conventional multilayer bushes and the metal back of which faces the pin and is likewise connected fixedly in terms of rotation to this. Both proposals allow a door to be mounted mechanically after being unhinged, without the danger of damage to one of the sensitive multilayer bushes. <IMAGE>
