Abstract (en)
[origin: EP0150531A1] Fabric treatment compositions containing a narrow class of clays, having a low ion-exchange capacity and a narrowly-defined surface area. in combination with conventional cationic agents are disclosed. This binary combination can be incorporated into conventional textile treatment compositions inclusive of liquid, granular and substrate-like softening products. The technology is especially adapted for use in non-solid (liquid) compositions and is capable of providing unexpectedly improved benefits to the fibers treated therewith in a post-laundry operation.
