Abstract (en)
[origin: EP0151457A2] A folding box consisting of cardboard, corrugated board or the like and having, arranged in the region of the narrow side, a pouring aperture in the form of a pouring spout which can be pulled out from the narrow wall, is to be designed so that the folding box as a whole is extremely economical to produce and completely functional in use. To this end, the folding box as a whole is produced from a one- piece blank, and those parts of the blank which form the pouring spout are an integral part of the narrow wall itself and of the adhesion region bonded thereto. According to Fig. 3, the pouring spout is formed from an outer pouring spout triangle (13), a connecting wall (21) bonded thereto and a spout pivoting wall (20) which is connected to the connecting wall (21). <IMAGE>
