Abstract (en)

[origin: EP0152349A2] Cloth carrier intended to lift and transfer an inert human body, injured or ill, comprising a carrying plane and a plurality of handles. The carrying plane is comprised of two rectangular and similar cloth portions (1 and 2) arranged one on the other and made integral by a stitching (3) forming a grid, the handles (4) are comprised of cloth bands and are fixed to the edge of the carrying plane independently from each other, symmetrically with respect to the longitudinal axis of the carrier so that, on each side, a handle is immediately at the vicinity of each hand and two other handles at 1/3 and 7-12 approximately, respectively, of the length. The carrier avoids any handling of the body between the moment when the body is taken in charge and the medical attendance place.
