## Abstract (en)

[origin: EP0152380A2] The device includes a control lever (1) and push-button for moving a figure on a video screen. The linear movements of the lever are slowed down by a double effect oil damper (7). Since the oil damper limits the speed at which the lever may be moved, there is a proportional relationship between the force applied by the operator, and the speed at which the figure moves across the screen. The lever moves in a cardan joint (4) allowing movement in two perpendicular directions - with an inductive system providing the electronic control. A toothed wheel in the housing of the control allows the figure to be rotated on the screen.
