Abstract (en)

The invention concerns a prefabricated lining panel with heat insulation, which panel comprises a facade board (1) of concrete, to whose outer face the face material (2) of the facade is fitted and to whose inner face an insulation material layer (3) is connected. According to the invention, the specific rigidity of the material of the insulation layer (3) decreases as a function of the distance from the side facing the facade layer (1). Hence, the insulation layer (3) is attached to the facade board (1) from its more rigid side, whereby the softer side of the insulation layer faces the building (4) to be lined. The insulation layer (3) preferably comprises several adjoining glass wool layers, ventilation grooves (5) being formed into the most rigid one of the glass wool layers, which said ventilation grooves (5) are placed at the joint between the facade board (1) and the insulation layer (3).
