Abstract (en)  
[origin: EP0152494A1] 1. A cap for drinking cups, comprising a cap wall (12) having a downwardly extending peripheral edge (14) and a lip resting hutch (16) offset from the cap centre to the edge, arranged in one half of the cap and associated with the peripheral edge (14), and a discharge opening (36; 37) situated in a cross plane (2-2) containing the cap wall centre and the hutch centre, characterized in that the peripheral edge (14) and the associated hutch wall (32) of the lip resting hutch (16) are raised in this associated area and have their maximum height in the said cross plane (2-2), that the peripheral edge (14) runs symmetrically and continuously from this point (24) of maximum height in both directions into the non-raised edge sections (26), that the surface (30, 32) of the lip resting hutch (16) at least in the area of this point (24) of maximum height in a continuous way extends onto the cap edge (22), and that the discharge opening (36, 37) is formed as a extending in this cross plane (2-2) and starting with an interspace from the point (24) of maximum height of the cap edge (22) and extending in direction to the hutch centre.
