Abstract (en)

[origin: EP0152917A2] 1. Apparatus for the continuous drawing off of wire via a deflection device, preferably a deflection drum or a deflection roller consisting in each instance of one of at least two unwinding cells, from a wire coil, in which the wire coil rests on at least one weight-sensitive switch, characterised by the fact that the weight-sensitive switch (16) can interrupt the continued drawing off of the wire when the weight falls below a particular value corresponding to the remainder of the wire coil (8), and that outside the at least two unwinding cells (2, 2') a second switch (6') is located, by which the further drawing off of the remainder of the wire coil can remain switched on independently of the weight-sensitive switch (16).
