Abstract (en)

[origin: WO8501073A1] For each monitoring station there is provided a measuring member and a common processor (53) is affected to a plurality of measuring members, which processor groups the signal working processes with the same repetition rates into classes , and intermingles both classes during the progress thereof so that, as to the different monitoring positions, the corresponding signal treatment processes are repeated at least approximately periodically. It is thus possible to distribute the work load of the processors (53) without having to wave the processing periodicity; it is also possible with a given processor to simultaneously serve more monitoring stations in the case of a predetermined yarn speed.
