Abstract (en)
[origin: EP0154003A1] 1. An antenna (1), for caravans, boats and similar roofed rooms or vehicles adapted to be mounted on an antenna mast (9), which is able to be adjusted in height between a raised operational position and a shipping position lowered to a point just above the roof, and a holding means for attachment of the antenna (1) on the antenna mast (9), the holding means consisting of a clamping element (23) resting against the antenna mast (9) and anchoring part (7) able to be screwed to the same and connected with the antenna (1), characterized in that the holding means, not able to be detached in the shipping position, comprises a vertically aligned screw attachment means (25) by means of which the anchoring part (7), representing a carrier (11), is fixedly connected with the clamping element (23 and 23a), the downwardly turned actuating member (55) only being accessible from the lower side of the antenna (1), the clamping element (23 and 23a) being designed in the form of reversing means (19 and 66), with which the thrust forces transmitted via the vertical screw attachment means (25) in a vertical direction onto the clamping element (23 and 23a) are reversed in a horizontal radial direction towards the antenna mast (9) so that the clamping element (23 and 23a) is held biased against the antenna mast (9).
