Abstract (en)
Disclosed is a cartridge type ejector comprising a cartridge, a case and a cap, in which the case and cap can be used repeatedly only by exchanging an empty cartridge with a full cartridge. An exposure portion for exposing a part of the cartridge is formed on the case, and the content in the cartridge can be ejected by pressing the cartridge through this exposure portion. By attaching a pin to the interior of the cap, the operation of opening the top end of the cartridge can be performed within the cap. A window for observing this operation is formed on the cap.
