Abstract (en)
[origin: WO8501479A1] The device is intended to automatically turn the pages of a document laid on a support (2) which is part for example of a desk (1). It is of the type comprising a movable element (5) controlled by a motor of which the operation is controlled by a control member (15) to be actuated by a user. It is characterized in that it comprises means such as a sucking tube (20) to lift a page as well as a movable element comprised of a double acting pusher (5) which is situated straight above the document laid on the support (2) and movably mounted in linear translation in the two opposite directions transversally to the side of the pages of a document and along which they are bound together, when such document is laid on the support (2). The sucking tube (20) and the pusher (5) are also movably mounted perpendicularly to the plane of the support (2).
