Abstract (en)
[origin: EP0157903A1] 1. Process for the synthesis of speech in which combinations of a consonant followed by a vowel are stored and read out as required, characterised in that - every consonant occurring in the language is stored together with a weak uniform vowel "&", - all the vowels occurring in the language are stored individually, - the desired consonant/vowel combination is formed by staggered reading out of consonant and vowel in two channels, with the uniform vowel "&" being masked by the vowel that is read out.
