Abstract (en)
1. Package carrier for the handling of threads or yarns, comprising two end rings and a plurality of elements (9-12, 14, 11', 11", 12', 12") constituting intermediate rings and forming a perforate annular sleeve, with said elements being connected in the axial direction by spacer element ((1-8 ; 3', 5', 6', 8') arranged in the annular sleeve and formed as ribs, wherein at least those elements (9-12, 14, 11', 11", 12', 12") forming the intermediate rings lie with their outer peripheral surfaces always within the annular sleeve surface (19, 18), characterized in that the annular sleeve surface (19, 18), viewed in the axial direction, has sections of larger and smaller diameter which follow one another successively, and the elements which form spacer elements at least between such intermediate rings and which overlap each other in the radial direction are substantially in alignment in the axial direction.
