Abstract (en)

[origin: EP0158578A1] 1. A wall for a prefabricated construction consisting essentially of a galvanized sectional metallic armature (1) having, at regular intervals, undulations in the form of grooves which determine the thickness of the armature (1), of an internal panel (3), of an external insulating layer (5) and of an external finishing coat (6), characterized in that the metallic armature (1) is gripped, at its upper and lower ends, between two clamping rails (2), an upper one and a lower one, which are connected to one another by means of through galvanized tie-rods (2') for the vertical connection, in that the internal panel (3) is made of plywood or in the form of chip board, is fixed to the armature (1) to stiffen it and forms a wind bracing of said armature (1), in that the armature (1) is further provided with an internal insulation and coating complex (4) fixed to the stiffening panel (3), and in that the vertical edges of the armature (1) are provided with small metallic plates (7) provided with holes (8) which are aligned vertically and adapted for the passage of rods (9) for connecting said vertical edges of the walls to form the angles of the construction.
