Abstract (en)

A rotary machine (1) for fluid comprising a working chamber (2) enclosed between two bodies (3, 4) disposed eccentrically with respect to one another and including at least one intake aperture (37) and outlet aperture (38) in communication with this chamber (2). The principle characteristic of this machine lies in the fact that these two bodies (3, 4) are both rotatable with respect to a fixed structure (10) including these apertures (37, 38), and in that these two bodies (3, 4) are joined together by means of at least one associated connection and sealing element (24) defining at least two variable volume chambers (28) such that a rotation imparted to one of the two bodies (4) is transmitted to the other (2).
