Abstract (en)

[origin: WO8505348A1] The device comprises a bobbin (5) carrying a reserve winding (10) to which the yarn is tangentially supplied through a supply guide and from which the yarn is delivered at a speed corresponding to the supply speed through an unwinding guide provided adjacent to the bobbin (5). To provide for an appropriate supply even when using a bobbin (5) controlling the reserve winding feed by means of its particular shape, the supply guide is comprised of a stirrup (20) having a slot (22) for the yarn. The slot of the stirrup is arranged transversally to the yarn supply direction and its edge is located under the upper edge of the bobbin (5).
