Abstract (en)  
An improved garage door is in the form of at least two sub-assemblies (3, 4) which may be interlocked (9, 10) to form a door of the desired dimensions, each of the sub-assemblies having one or more bracing struts (8) which run at an angle relative to the edges (6, 7) of the sub-assembly (3, 4) and are confined essentially within the limits of the latter. A preferred means of interlocking (9a, 9b, 10a, 10b) is described.
