Abstract (en)  
[origin: EP0161965A1] 1. Roof with a double shaped wall (1, 2) and insulating substance (3) inserted between both walls (1, 2) the wall elements having in transverse section a shape such that each of them clings to the next element by interlocking of one of its longitudinal edge with the longitudinal edge of said next element, each element (1) of the outer wall having a clinging longitudinal edge (A-B-C) and on opposite longitudinal edge (E-F) having such a shape that it can be engaged with the profile of the clinging edge of the next element and being associated with an element (2) of the inner wall, both associated elements (1, 2) being disposed one underneath the other, in order that the clinging edges (ABC-A'-B'-C') of both associated elements project with respect to the double element (H) constituted by both elements (1, 2), characterized in that the inner elements is of the same shape as the outer element and is disposed underneath the latter after having been submitted to a rotation of 180 degrees about a vertical axis.
