Abstract (en)

[origin: EP0162028A1] In a door (10) with a decorator plate (13) for a domestic appliance, preferably a dish-washing machine, the door (10) is pivotally supported at its lower end and provided with a control panel (16) at its upper end. When the door is closed the decorator plate (13) and the panel (16) form an approximately continuous front surface of the door. The decorator plate (13) is pivotally supported in points situated below the support of the door and is linked to the door (10) by link arms (14) disposed at the two sides of the door. The decorator plate (13) is acted upon by spring means (28, 29, 30) to abutment against the door (10) when the door is in closed position or within the area adjacent the closed position. In the other set positions of the door the decorator plate (13) is completely released from the spring means (28, 29, 30).
